

Product Profile

*All our strawberry varieties are seed propagated F1-hybrids. They belong to the large fruited strawberry species *Fragaria x ananassa* Duch.*

Perfect seed quality

One gram of seed contains 1600 - 2200 seeds.

The seed can be sown by machine or by hand.

After 4 - 7 days seed starts to germinate.

For professional market wij deliver our seeds with a germination rate higher than 90% (Germ 90+).

From sowing date seedlings are ready to be pricked out in final trays after 4 - 5 weeks.

Minimum risk of disease transmission

Seed offers a better guarantee for disease free plants at the start of the culture.

Vigorous and healthy plants

The F1-hybrid nature of our varieties will result in vigorous and healthy plants.

From sowing to harvest: 3 - 5 months

Seedlings develop unhampered into productive plants; harvest will start 3 - 5 months after sowing the seed.

Fruit with flavour

In our breeding programme we pay a lot of attention to the flavour of the fruit.

Day neutral: long harvest season

The day-neutral character of our varieties means that harvest will continue as long as growing circumstances remain favourable. Even in an annual culture yields are very acceptable.
